

Detailed report on Arduino projects

Name: Narahari Sumanth

Reg no: RSAGWPVLSI14

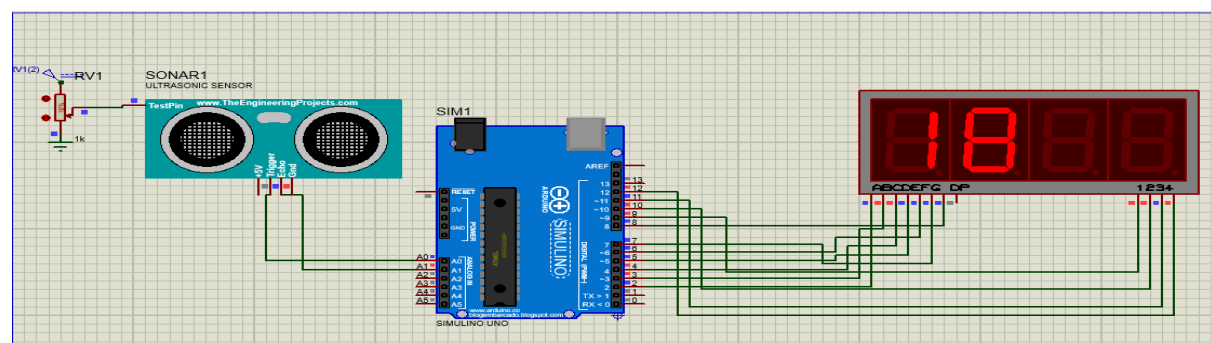

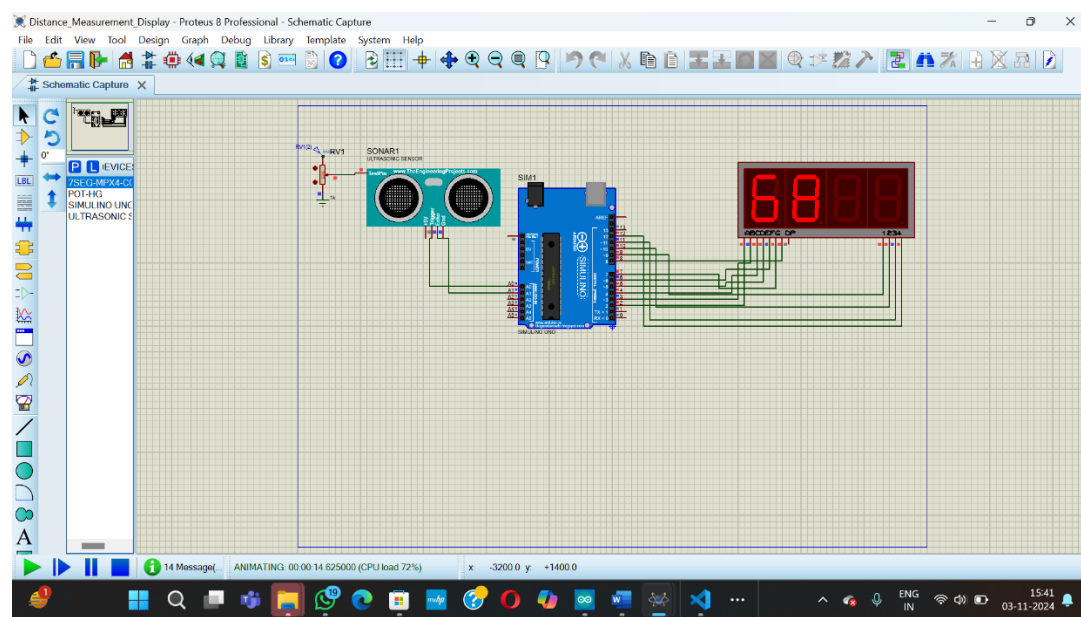

1.Distance Measurement Display

Components used: Ultrasonic sensor (HC-SR04), 7-segment display

Objective: Measure the distance of an object and display it in real-time on the 7-segment display.

Working Principle: The ultrasonic sensor emits ultrasonic waves, measures the time taken for the waves to return after hitting an object, and calculates the distance. This value is displayed on the 7-segment display.

Result: The 7-segment display accurately displayed the distance measured by the ultrasonic sensor in centimeters, updating in real-time as the object's distance varied.

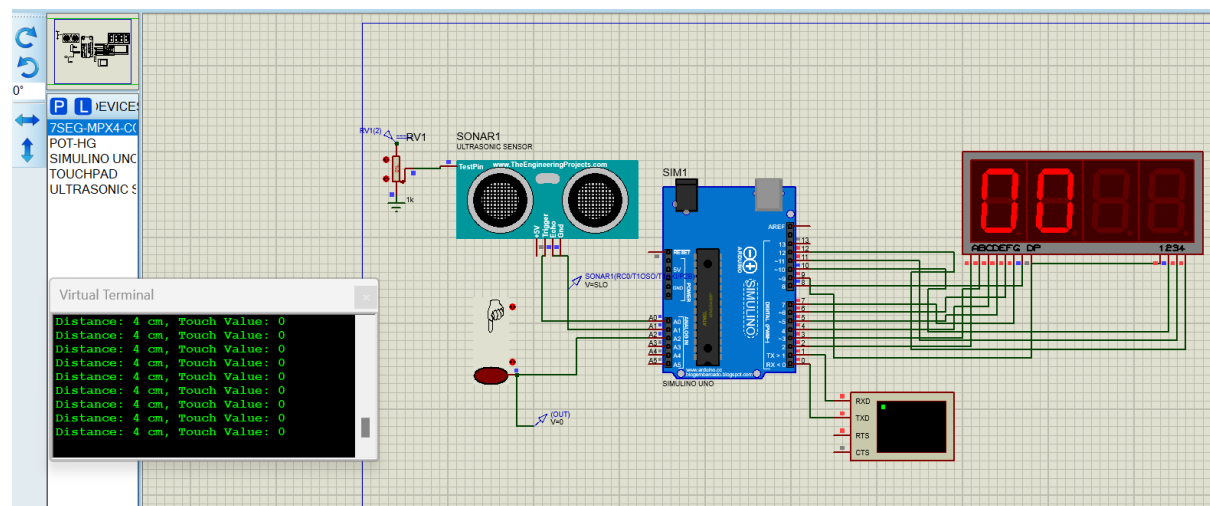

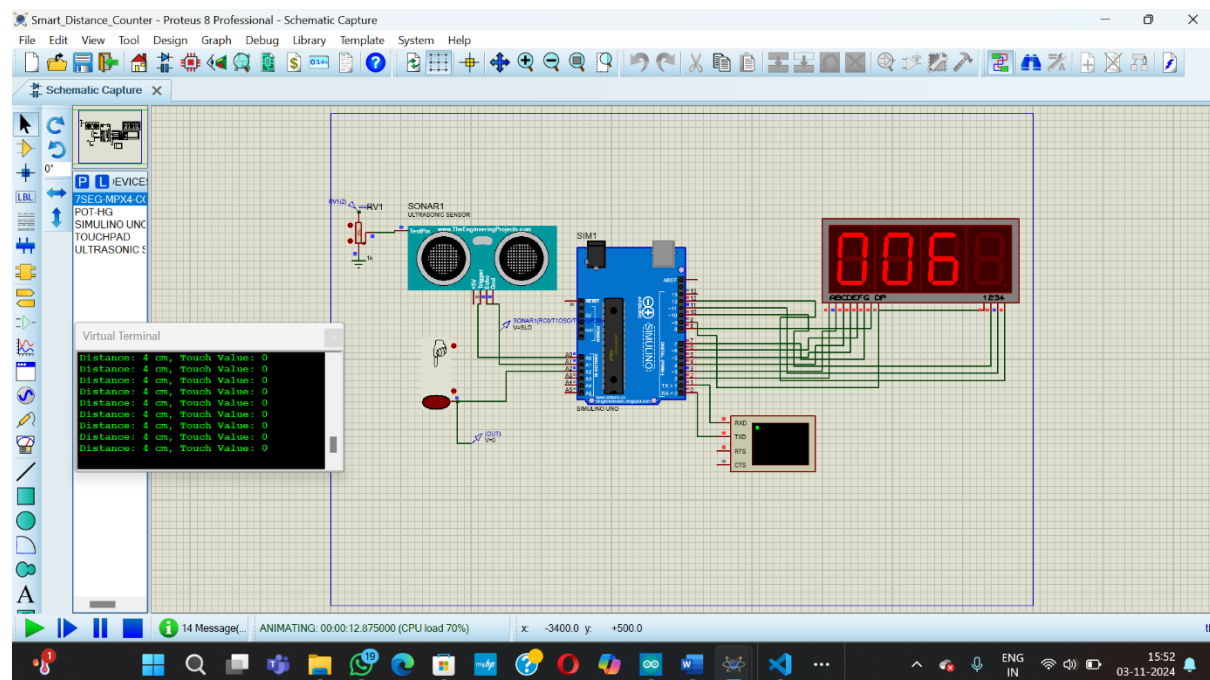

2.Smart Distance Counter

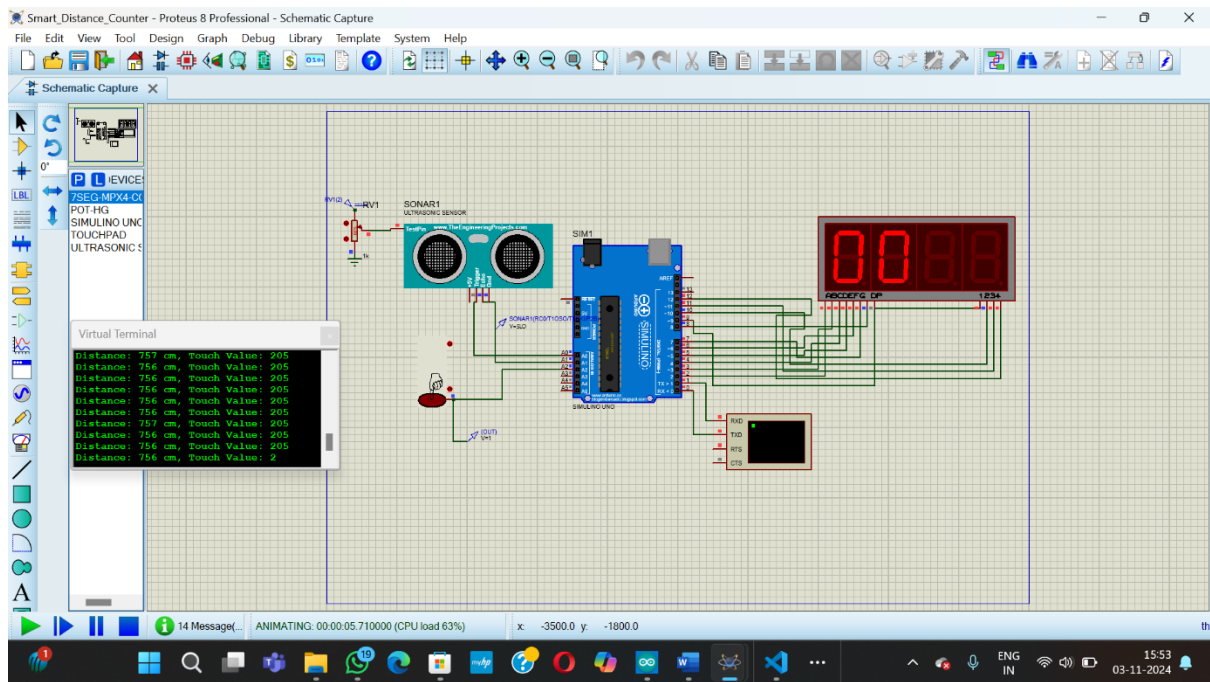

Components used: Ultrasonic sensor, touch sensor, 7-segment display

Objective: Increment a counter each time an object crosses a specific threshold distance, and reset the counter via a touch sensor.

Working Principle: The ultrasonic sensor continuously monitors distance. If an object crosses a preset threshold (e.g., less than 10 cm), the counter on the display increments. Pressing the touch sensor resets the counter.

Result: The counter accurately tracked the number of threshold crossings, and the touch sensor reset the counter without errors.

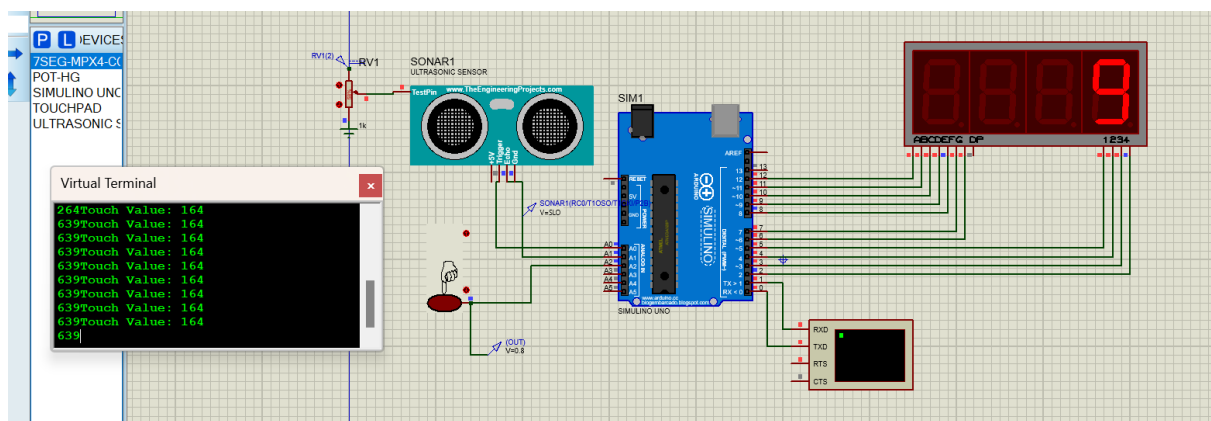

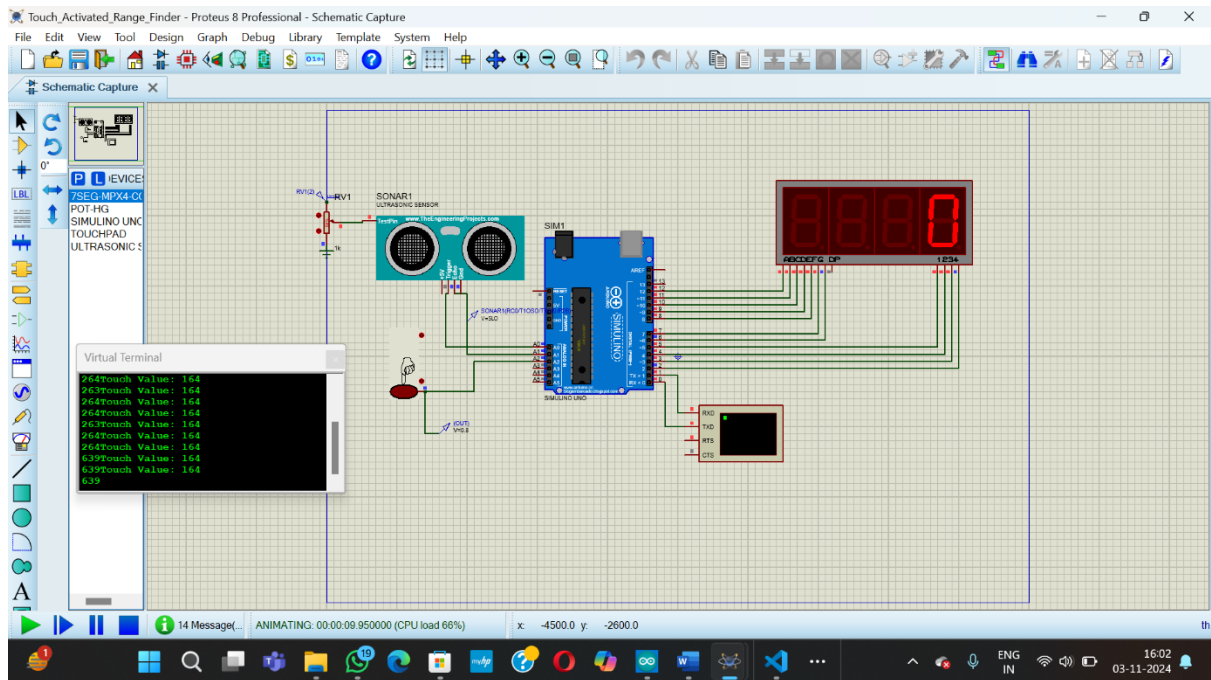

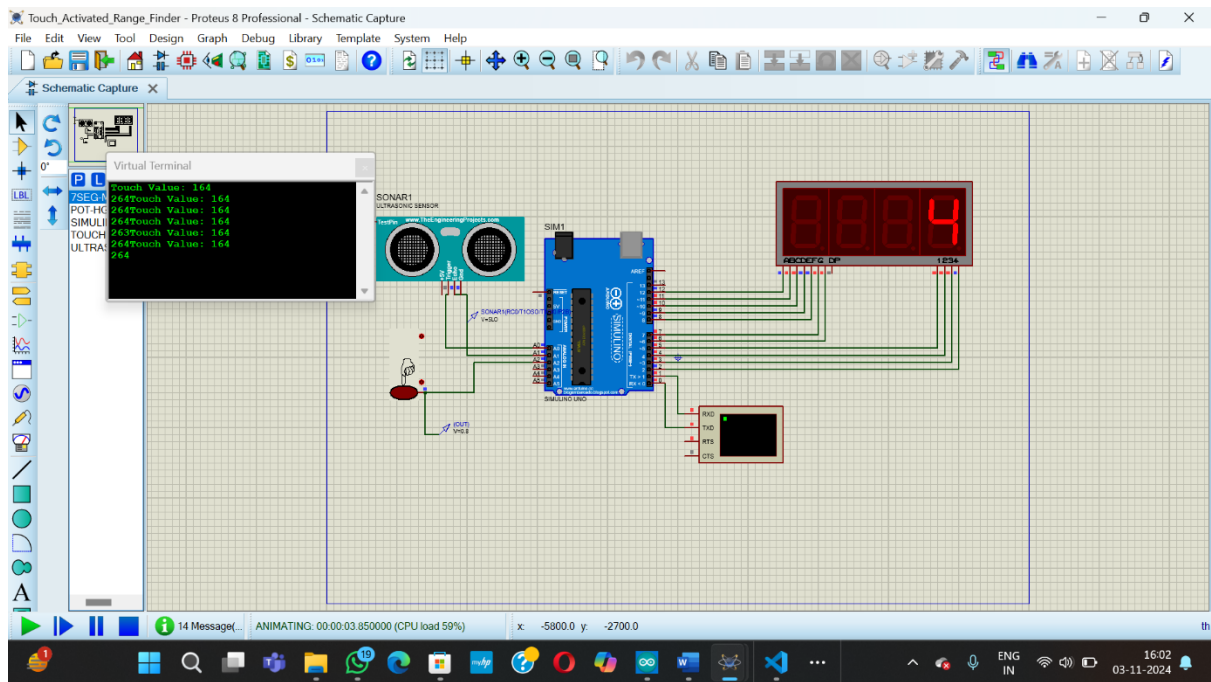

3. Touch-Activated Range Finder

Components used: Ultrasonic sensor, touch sensor, 7-segment display

Objective: Take a distance measurement only when the touch sensor is pressed, hold the displayed value for 5 seconds, then clear it.

Working Principle: The system remains idle until the touch sensor is activated, then takes a reading using the ultrasonic sensor. This reading is displayed for 5 seconds before the display clears.

Result: The display correctly showed the measured distance for 5 seconds after activation by the touch sensor and then cleared as programmed.

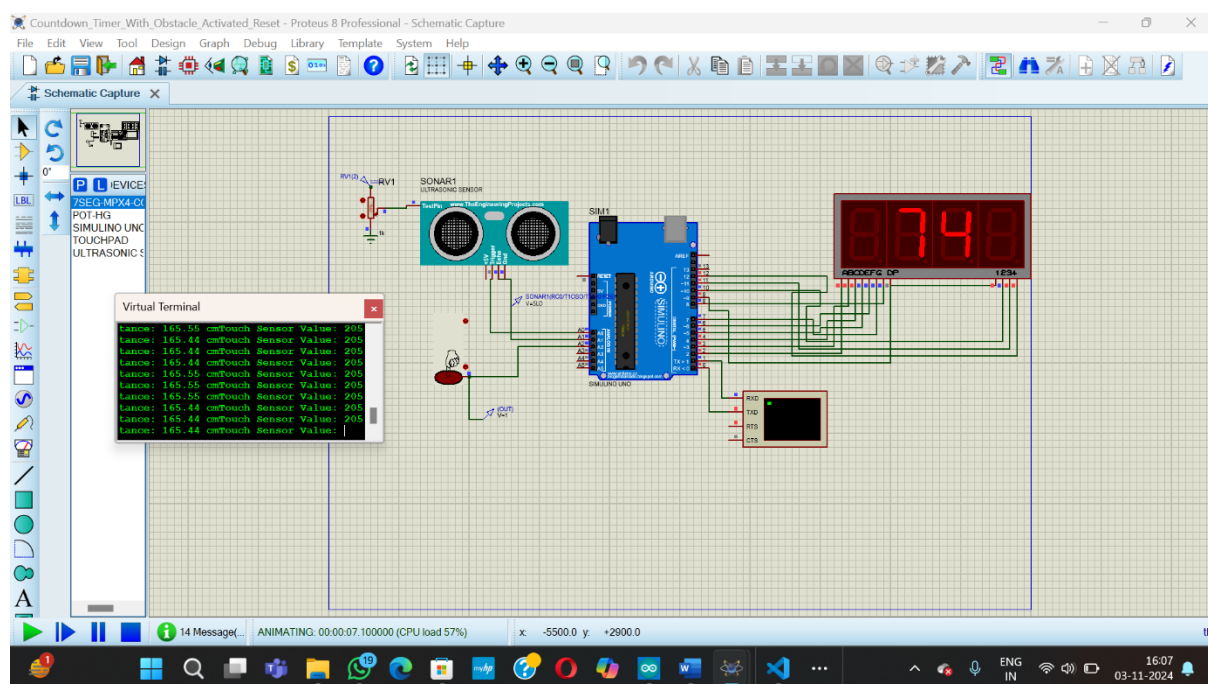

4.Countdown Timer with Obstacle-Activated Reset

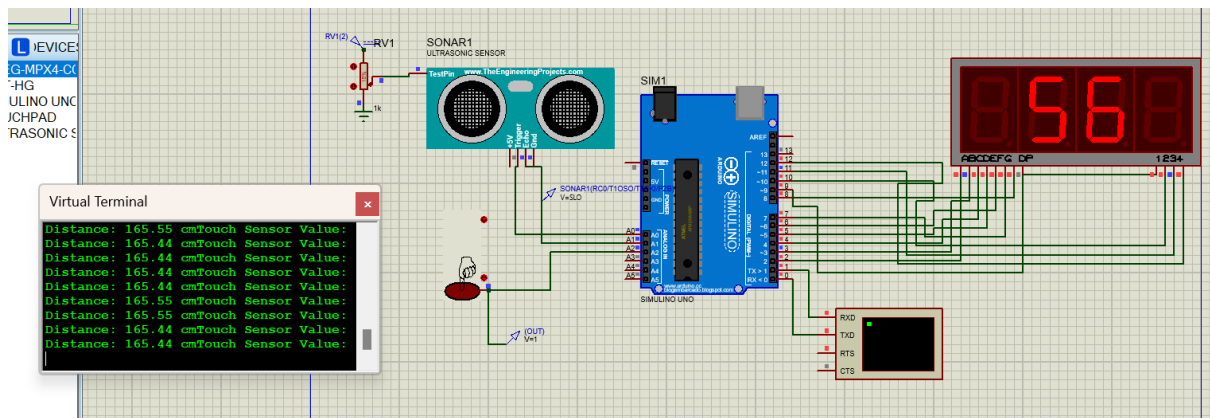

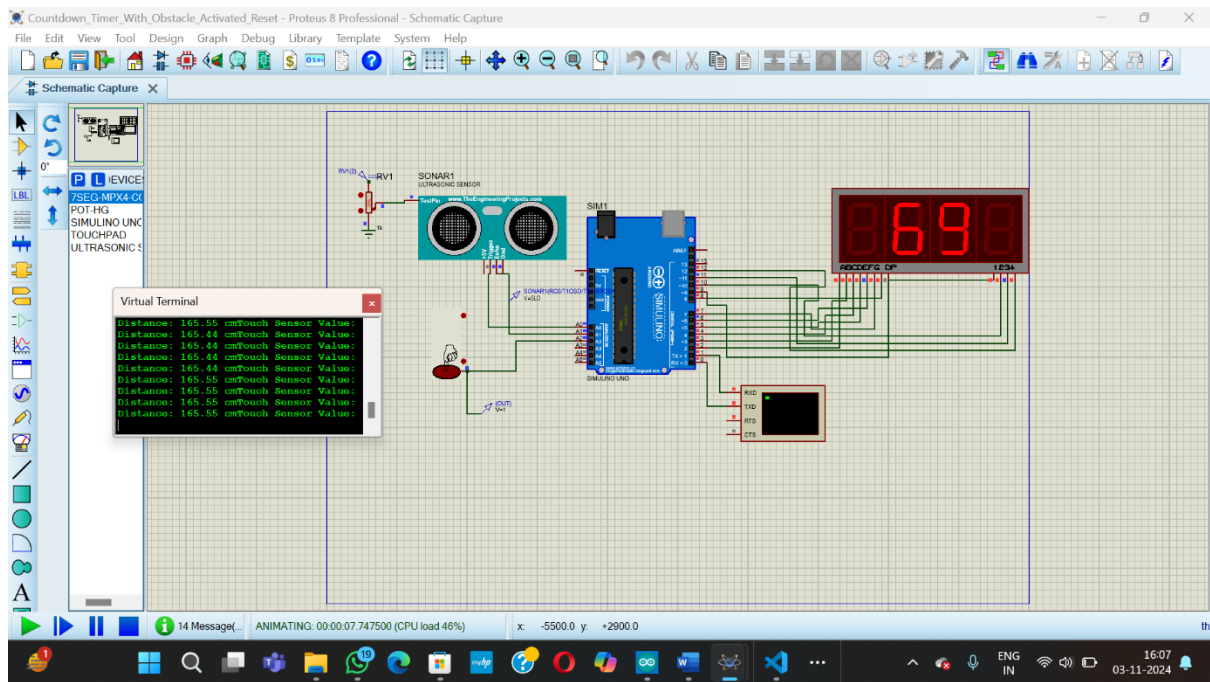

Components used: Ultrasonic sensor, touch sensor, 7-segment display

Objective: Start a countdown timer using the touch sensor. Reset the timer if an obstacle is detected within a specified range. Display "E" if the countdown completes without interruption.

Working Principle: Pressing the touch sensor initiates a countdown. If an obstacle (detected by the ultrasonic sensor within a certain range, like <10 cm) interrupts the countdown, the timer resets. If no interruption occurs, "E" is displayed.

Result: The countdown functioned correctly with the obstacle-based reset, and the display showed "E" when the countdown completed without interruption.

5.Digital Stopwatch

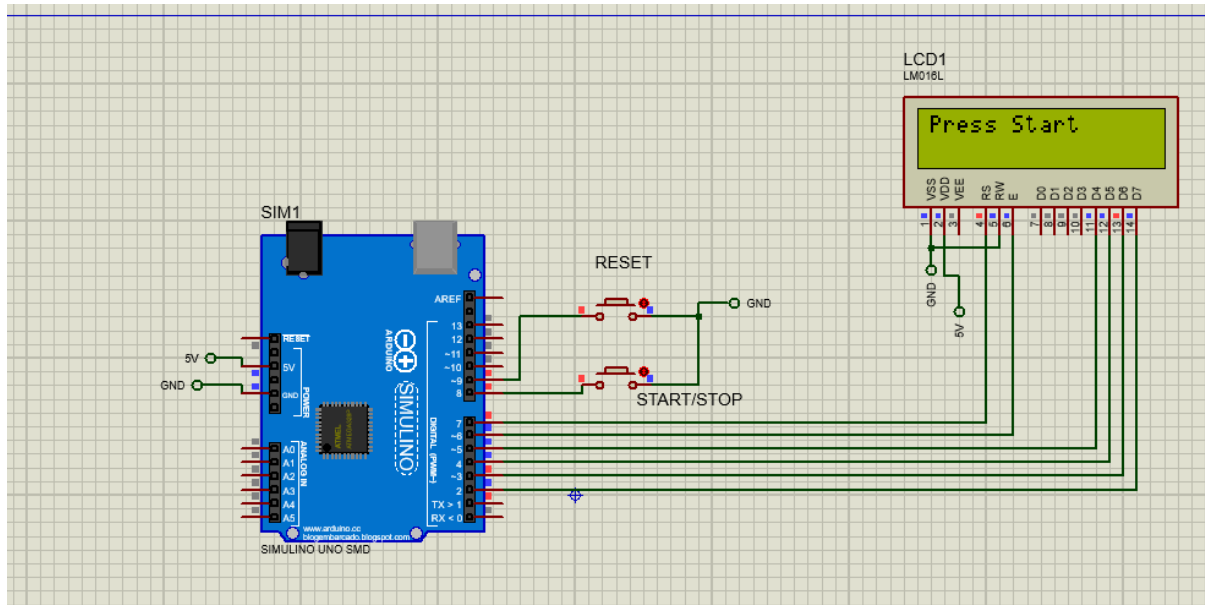

Components used: LCD display, two buttons

Objective: Create a stopwatch that starts/stops with one button and resets with the other.

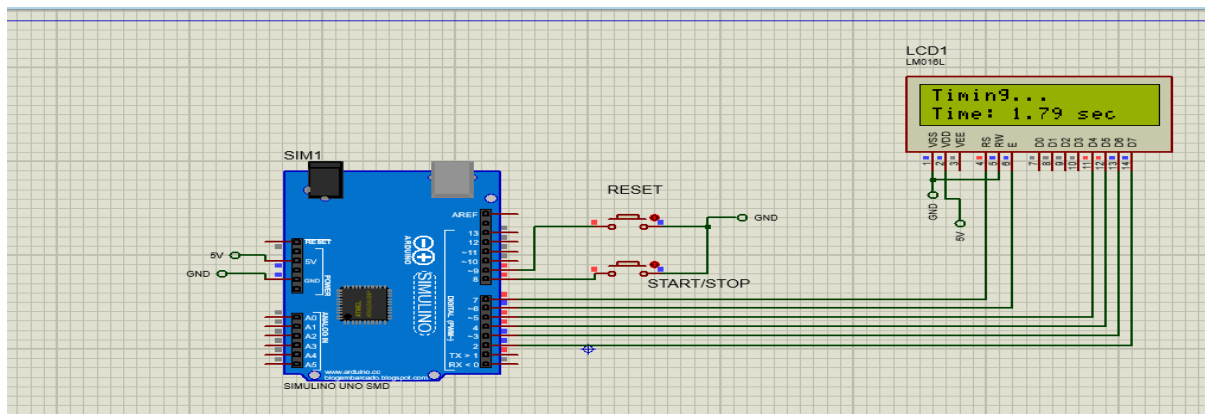

Working Principle: Button 1 toggles between starting and stopping the stopwatch, while button 2 resets the time to 0.

Result: The stopwatch accurately started, stopped, and reset, with clear display of elapsed time on the LCD.

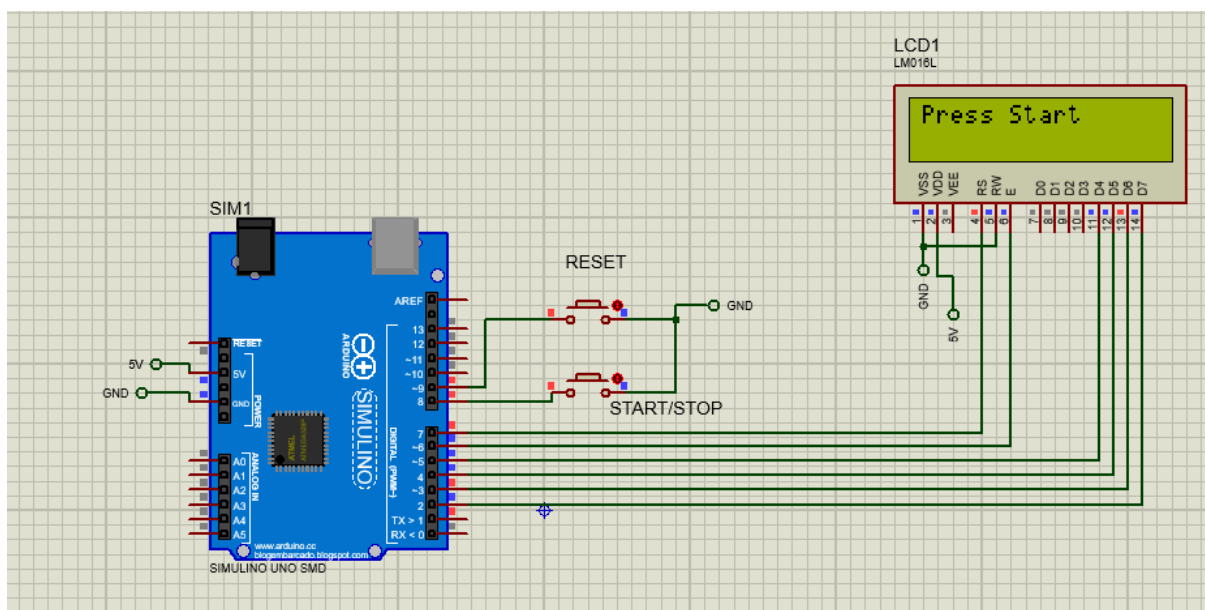

Initial start condition

After starting

After resetting

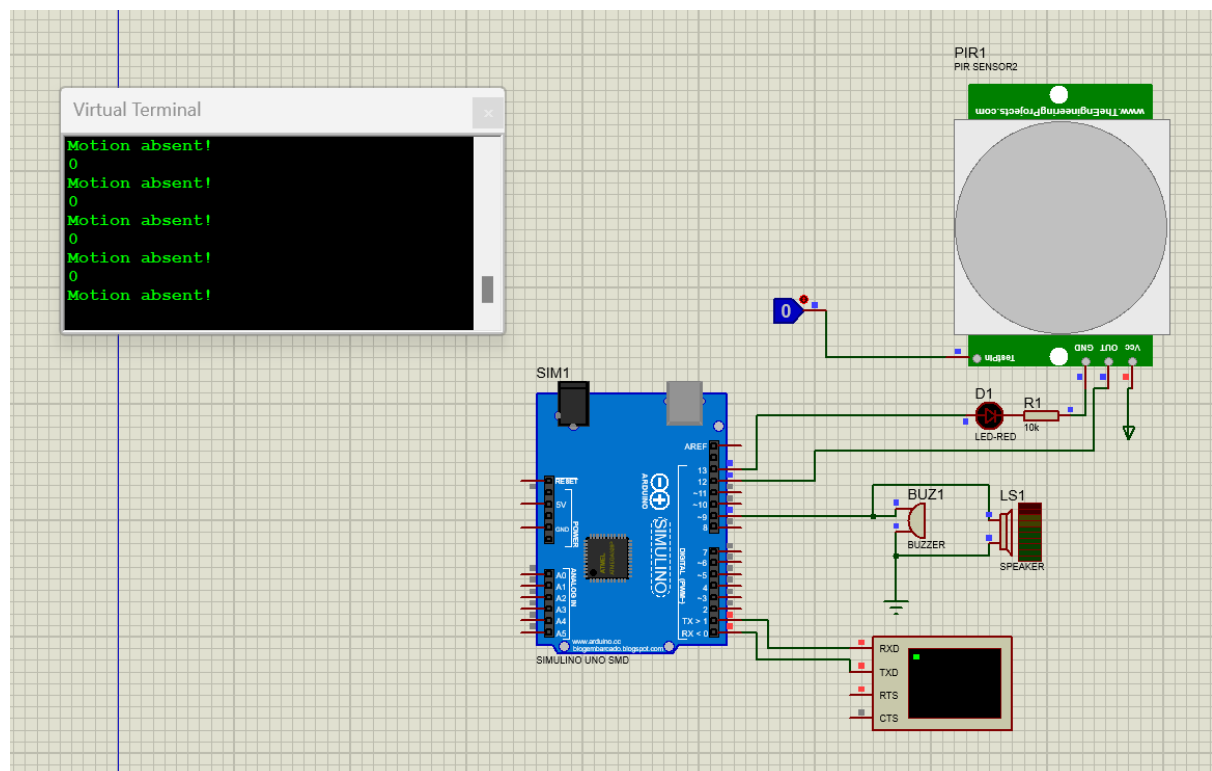

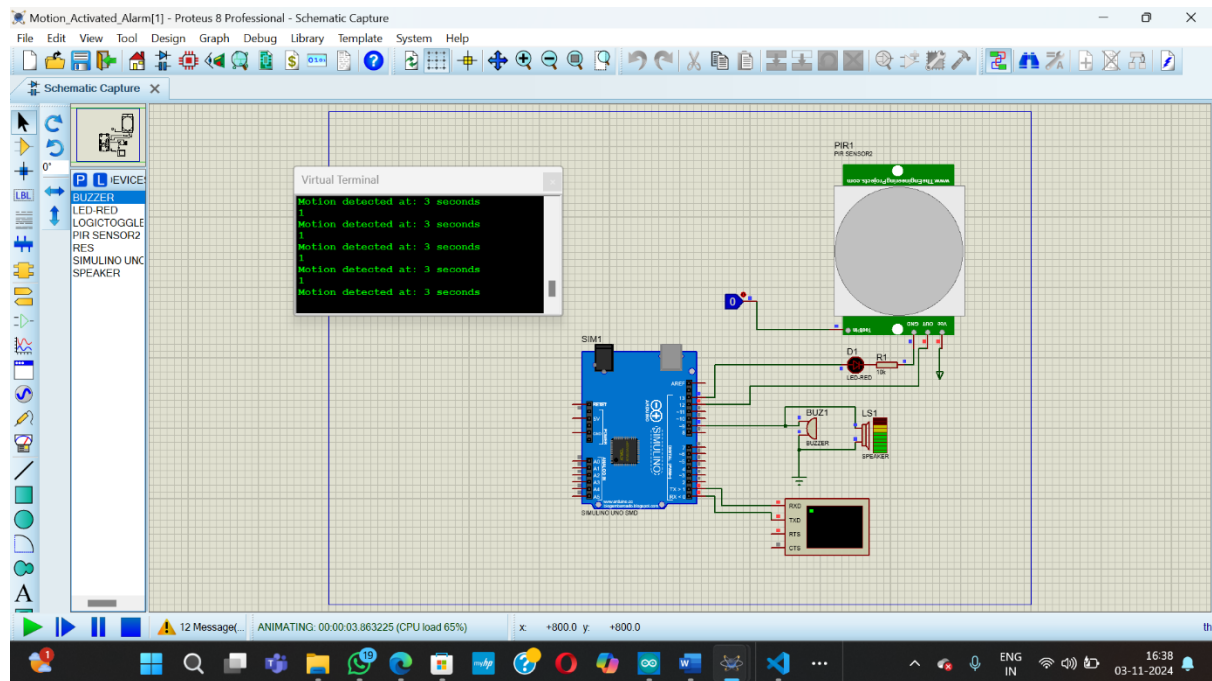

6.Motion-Activated Alarm

Components used: PIR motion sensor, buzzer

Objective: Sound an alarm when motion is detected and log each event timestamp in the Serial Monitor.

Working Principle: The PIR sensor detects movement, triggering the buzzer and sending a timestamped alert to the Serial Monitor.

Result: The alarm successfully sounded upon motion detection, and accurate timestamps appeared in the Serial Monitor for each event.

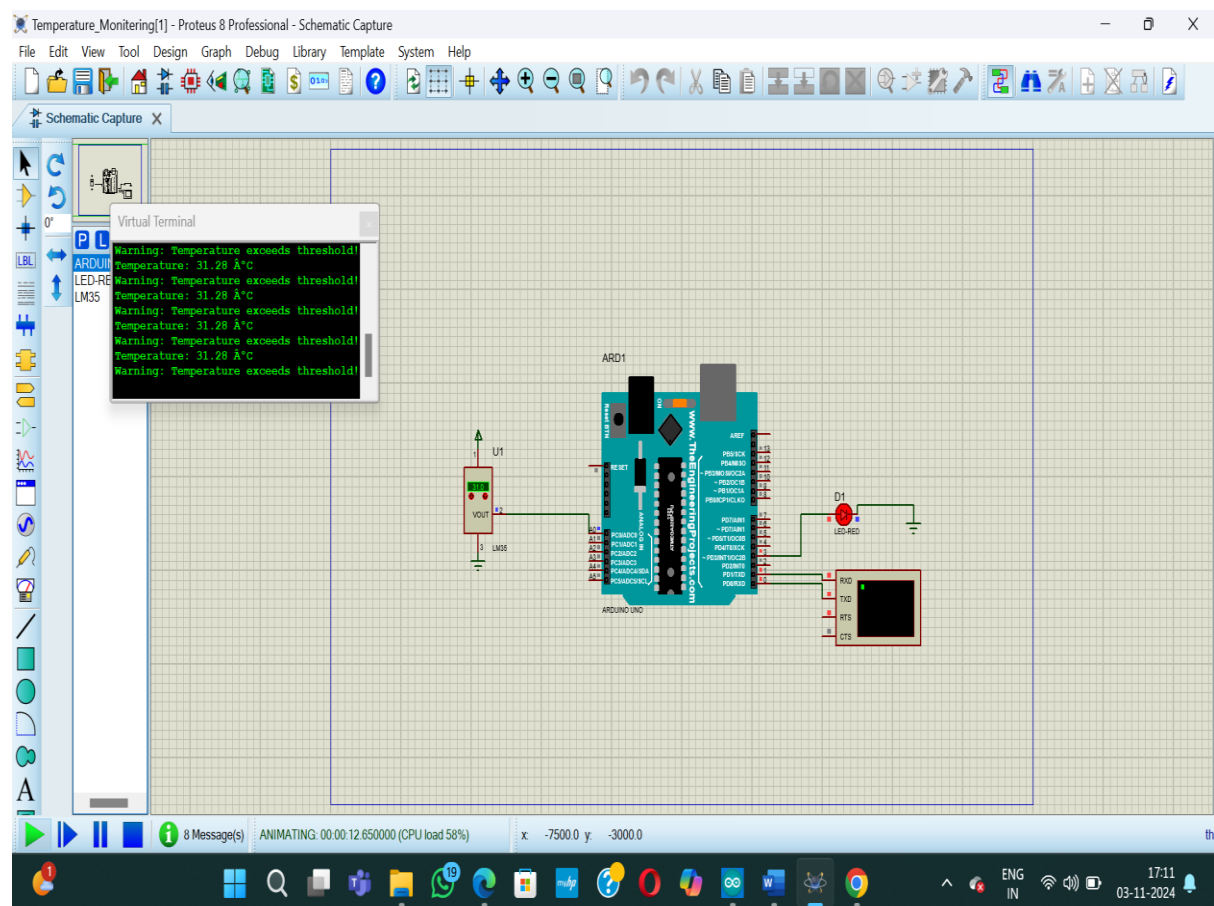

7. Temperature Monitoring System

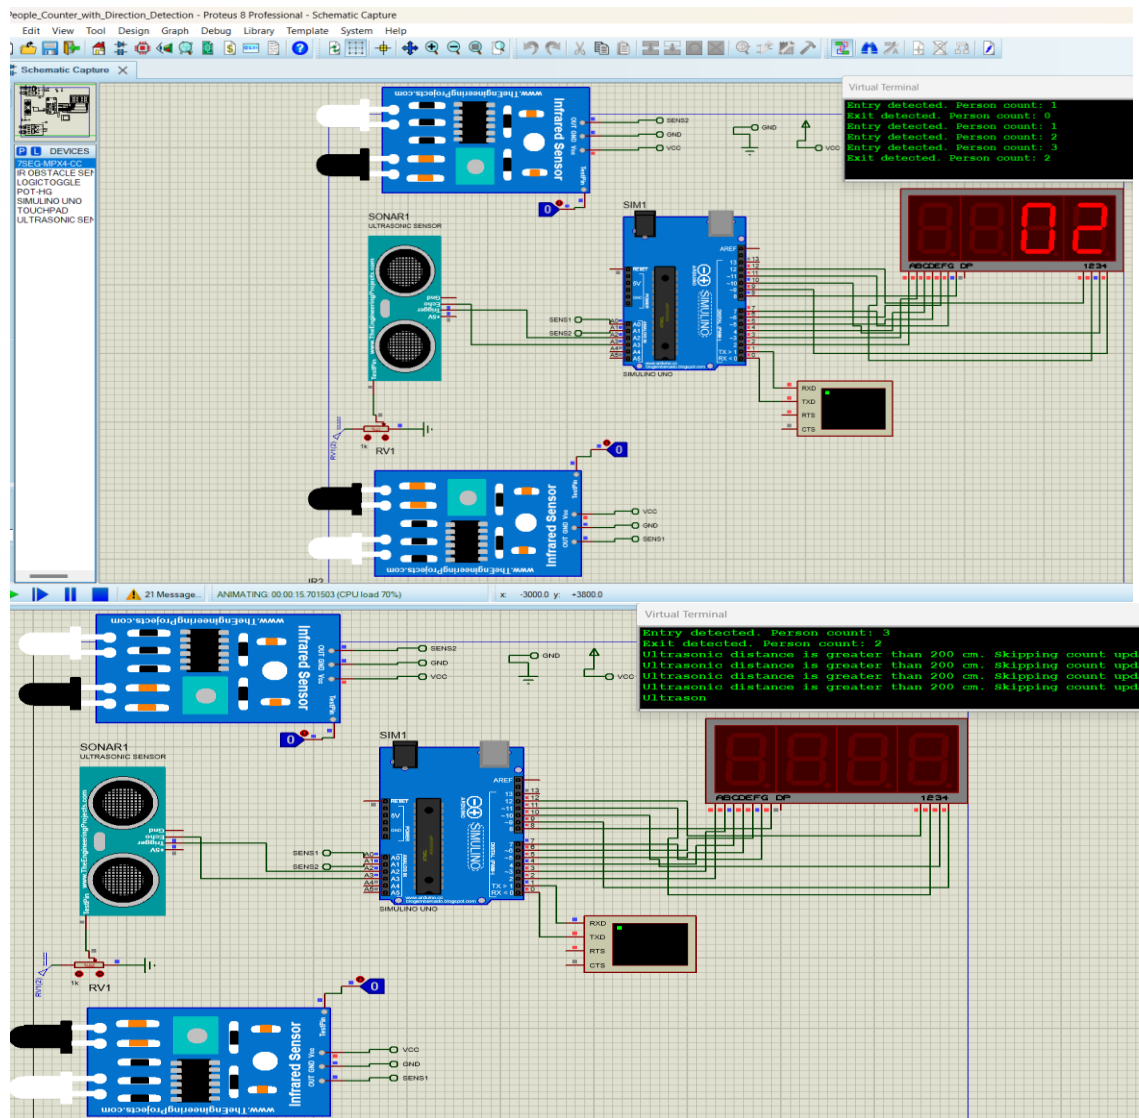

Components used: DHT11 or LM35 temperature sensor

Objective: Monitor temperature readings and display data on the Serial Monitor. Trigger a warning if the temperature exceeds a set threshold.

Working Principle: The sensor measures the temperature, which the Arduino reads and displays in the Serial Monitor. If the reading exceeds a specified threshold, a warning message is displayed.

Result: The system displayed accurate temperature data and provided timely warnings when the threshold was breached.

Each project showcases effective use of sensors and displays, enhancing real-world applications of distance, motion, temperature, and counting.
